Repeat European Business For WDT

Wellington Drive Technologies (NZSE:WDT) today announced it had received an order to develop a new version of the DE066 motor and CH070 controller.

"It relates to the order we announced in December 2001 where our motors are used by a European company in premium air extractors," said WDT managing director, Dr Ross Green.

"We met our dates for delivery and European product certification. Now our customer wishes to launch their product in major markets outside Europe."

"Some of these markets use 100V or 115V electricity supplies, and the new order covers the engineering associated with the changes. We expect production to begin here in WDT's Auckland facility in due course."

Made from specialised plastics, permanent magnets and electronics, WDT's brushless motor design offers lower noise and longer life than conventional approaches. It also requires less than half the energy to run and can be made in virtually any shape.

Due to the extremely competitive nature of the European air-moving market, WDT is not disclosing the name of the customer company.

Ends.
