New United States Patent Granted

Wellington Drive Technologies Ltd. (“Wellington”) advises that it has been granted a new United States patent. The new patent covers the company’s proprietary method for producing motor windings and motor stator assemblies. The newly patented method is notable for enabling the construction of electricity-saving motors with simplified assembly processes and low scrap rates, compared to other motor manufacturing methods, and is currently being used on an industrial scale in several catalogue Wellington products. It is also used in Wellington Total Integration products designed for other companies. European patents have already been granted on the method, and patent applications in other major countries are proceeding. In addition, Wellington has four other new patents at various stages of the international approval and grant process. These patent applications cover new techniques for motor manufacturing, and methods for the electronic control of the company’s proprietary, electricity-saving motors. The company plans to continue applying for patents, when appropriate, on new techniques that are central to its manufacturing processes and product lines. Wellington believes its current portfolio of issued patents and patent applications, together with other intellectual property (“IP”) that it owns, gives a good degree of formal IP cover to its existing product lines. The company’s on-going development activities are expected to yield further patent applications in the future, with a view to maintaining the strength of the IP portfolio long term.
